

# Agilent 6850 Automatic Liquid Sampler G2880

# 6850 Automatic Liquid Sampler

The Agilent Technologies 6850 Automatic Liquid Sampler (ALS) is specifically designed for use with your 6850 Gas Chromatograph (GC). The sampler consists of an injector module with a high sample vial capacity turret. It mounts directly onto your 6850 GC and is controlled by your Agilent G2629A Control Module, Agilent Cerity NDS system, or Agilent ChemStation.

turret

# Installation of your Agilent 6850

## Requirements

The 6850 ALS requires a 6850 GC with firmware revision A.03.xx or higher. Check the GC serial number next to the on/off s--witch. If your GC serial number is  $\geq$  US00001500, you have the correct firmware installed. If you are unsure, please check it by using a **G2629A Control Module**.

### Using your 6850 ALS

### **6850 ALS Capabilities**

Your 6850 ALS comes with a turret that holds up to 27 2-mL sample vials. Also available is an optional turret holding up to 22 4-mL sample vials. With either turret, the 6850 ALS can use up to two bottles each of two solvent types, and uses three bottles for waste collection.

The features and general capabilities of your 6850 ALS are listed in Table 1, along with an explanation of the benefits of each.

#### Table 1. 6850 Automatic Liquid Sampler Capabilities

#### **General Options**

| Syringe size           | 5, 10, 25, 50, and 100 μL                        |
|------------------------|--|
| Injection volumes      | 2%, 10%, 20%, 30%, 40%, or 50% of syringe volume |
| Syringe rinse solvents | Solvent A: two 4 mL bottles                      |
|                        | Solvent B: two 4 mL bottles                      |

#### **Injection Parameter Control**

| Parameter   | Range  | Benefits  |
|---|--|---|
| Variable sampling depth   | –2 to +30 mm above<br>default position             | Accesses very small sample volumes<br>Accesses a specific layer in a two-phase<br>sample<br>Avoids aspirating sample particulates |
| Pre-injection syringe<br>rinsing and post-<br>injection syringe rinsing | 0–15 rinses using<br>solvent A and/or<br>solvent B | Minimizes sample carryover<br>A pre-injection rinse wets the syringe<br>without consuming sample                                  |
| Sample prewashes  | 0—15 prewashes                                     | An additional way to minimize sample carryover  |

#### Injection Parameter Control

| Parameter  | Range                     | Benefits   |
|--|---------------------------|--|
| Viscosity delay, top of<br>plunger stroke                | 0–7 seconds               | Improves sampling accuracy of viscous samples  |
| Pre-injection sample<br>pumps                            | 0–15 pumps                | Ensures accurate and reproducible<br>sample volume<br>Removes bubbles  |
| Minimum sample<br>injection volume<br>(single injection) | 0.1 μL (5-μL syringe)     | Prevents overloading the column when using concentrated samples, on-column injections, or small-diameter columns                                 |
| Maximum sample<br>injection volume                       | 50 µL (100-µL<br>syringe) | Supports ambient headspace analysis<br>using gas-tight syringe   |
| Injection plunger speed                                  | Fast/Slow                 | Fast plunger minimizes needle<br>discrimination (see injection flow in<br>vaporizing inlets rate table)<br>Slow plunger mimics manual techniques |
| Pre-injection dwell time                                 | 0–1 minute                | Automatically fills needle with 1 μL of air<br>after sampling<br>Automates "hot needle" injection<br>technique                                   |
| Post-injection dwell time                                | 0–1 minute                | Mimics manual injection  |
| Injections per vial                                      | 1–99 injections           | For replicating sample analysis  |

#### **Injection Flow Rates**

|     | Syringe Size  | Plunger Parameter ( $\mu$ L/min) |       |
|-----|---------------|----------------------------------|-------|
|     | (μ <b>L</b> ) | Fast                             | Slow  |
|     | 5             | 3,000                            | 150   |
|     | 10            | 6,000                            | 300   |
|     | 25            | 15,000                           | 750   |
|     | 50            | 30,000                           | 1,500 |
|     | 100           | 60,000                           | 3,000 |
| CRE | cycling       |                                  |       |

### The sample turret

### Sample vials

The sample turret contains positions for 27 2-mL vials. The optional 4-mL sample vial turret has a capacity of 22 vials. See Figure 2. When used with Agilent Cerity NDS or ChemStation control software, the sample vials can be analyzed in random order. If controlled using a G2629A Control Module, you must load your sample vials in the order you want them run.

Figure 2. The 6850 ALS turret (2-mL version shown)

### Solvent and waste bottle usage

When a syringe is washed (both pre- and post-injection washes), it is filled to 80% of its full volume and then emptied into a waste bottle. Sufficient solvent must be available for the washes, and waste bottles must be present to receive the used solvent.

With either turret type, you can use one, two or four solvent bottles for pre- and postinjection rinses. The choice depends on whether you want to use different solvents for the two kinds of wash and on the amount of solvent needed for the samples you intend to run.

| Bottle     | Use   |
|------------|---|
| Solvent A  | Can be the only solvent bottle if usage is less than 2 mL. Either Solvent A or Solvent B must be present. |
| Solvent A+ | Additional Solvent A when usage exceeds 2 mL.   |
| Solvent B  | Can be the only solvent bottle if usage is less than 2 mL. Either Solvent A or Solvent B must be present  |
| Solvent B+ | Additional Solvent B when usage exceeds 2 mL.   |
| Waste A    | Empty. Receives waste from Solvent A and A+ washes. Required if Solvent A is used.                        |
| Waste B    | Empty. Receives waste from Solvent B and B+ washes. Required if Solvent B is used.                        |
| Waste C    | Empty. Receives waste from sample washes. Always required.  |

### How many bottles do I need?

|     | Bottles | When to use  |
|-----|---------|--|
| -   | 0       | You are not using pre- or post-injection washes  |
|     | 1       | Your solvent need is less than 2 mL<br><b>and</b>                                      |
|     |         | You want to use the same solvent for both pre- and post-injection washes               |
|     | 2       | Your solvent need is between 2 mL and 4 mL   |
| _   |         | <b>or</b><br>You want to use different solvents for the pre- and post-injection washes |
|     | 4       | Your solvent need exceeds 4 mL   |
| Rei | ycli    | ng   |

### What does my solvent need?

See the *Sampling Techniques* section on your *6850 GC User Information* CD-ROM for information on how to estimate the number of samples you can run using 2 mL of a solvent.

Good laboratory practice suggests that to reduce the possibility of contamination, only half the solvent in the 4-mL bottle be used. The injector will not access the last 2 mL in the bottle.

Solvent levels should always be maintained above the "min solvent level" marked on the solvent bottles.

# Filling the turret for use

- 1. Load all samples to be run into the turret. Make sure that you place them in the turret positions that correspond to the sequence (Control Module or ChemStation control) or Work List (Cerity control). The vial positions are labeled.
- 2. Load clean, empty waste bottles into the appropriate waste locations. Always load a bottle in the Waste C location.
- 3. Load your solvent bottles into the solvent locations as needed.
